

Network Setup and Demo

Darren Kara
Database Administrator

Networks

- Sponsor:

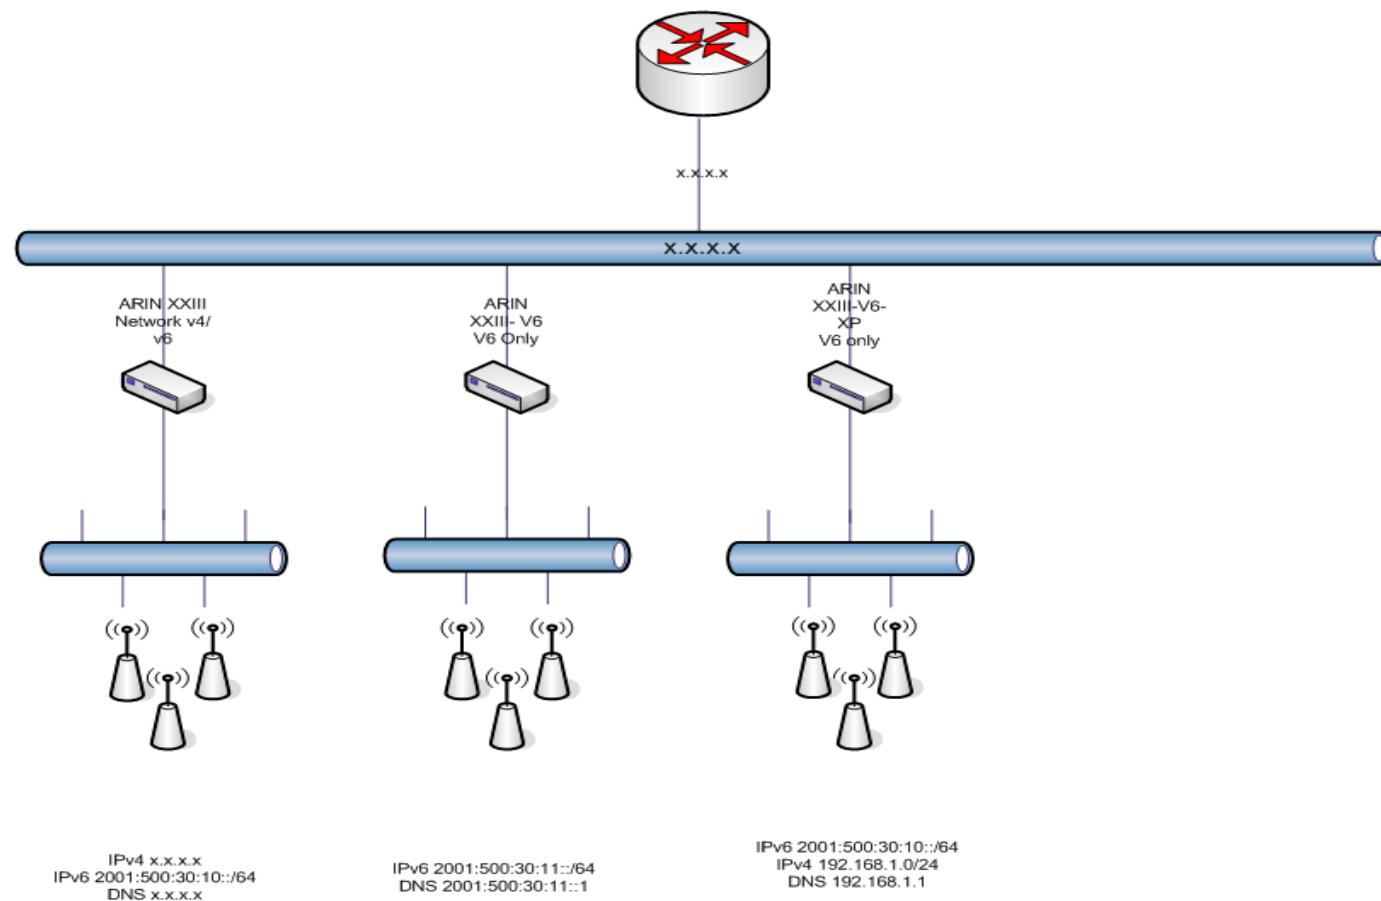

TIME WARNER CABLE
Business Class

- 3 Network segments
- Dual Stack
- IPv6 Only
- IPv6 Only Demonstration Network

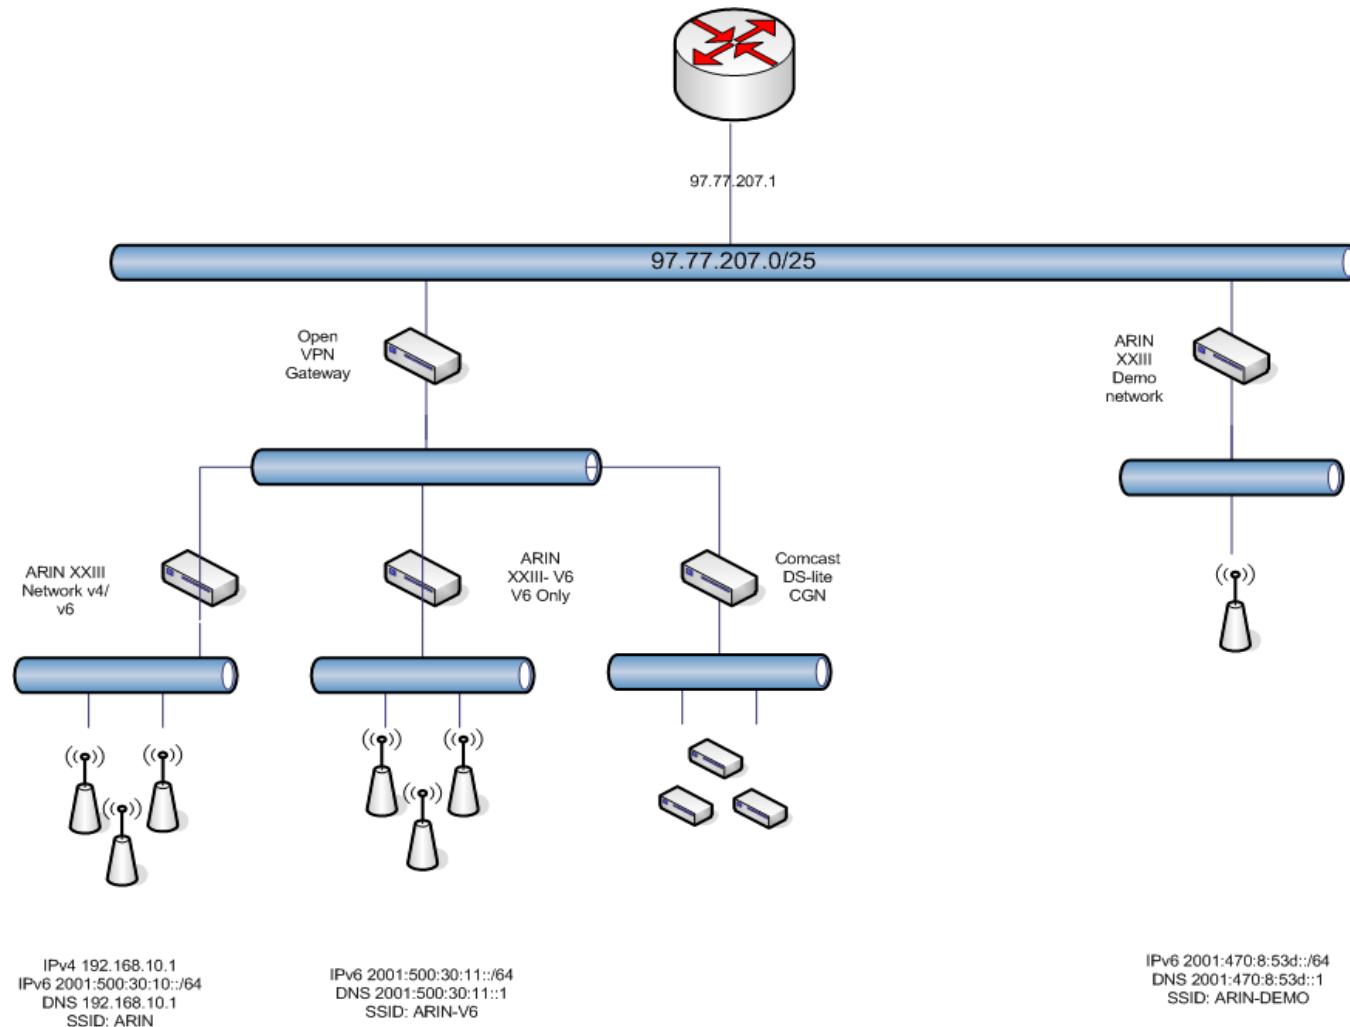

ARIN XXI Network Diagram

Past Meeting Layout

ARIN XXIII Network Diagram

Primary Meeting Network

- **SSID ARIN**
- Dual Stack IPv4/IPv6
- IPv4 Provided by Sponsor
- IPv6 Direct Allocation 2001:500:30/48
- IPv6 Tunneled using OpenBSD and OpenVPN
- ARIN IPv6 connectivity provided by Equi6IX and OCCAID

IPv6 Only Networks

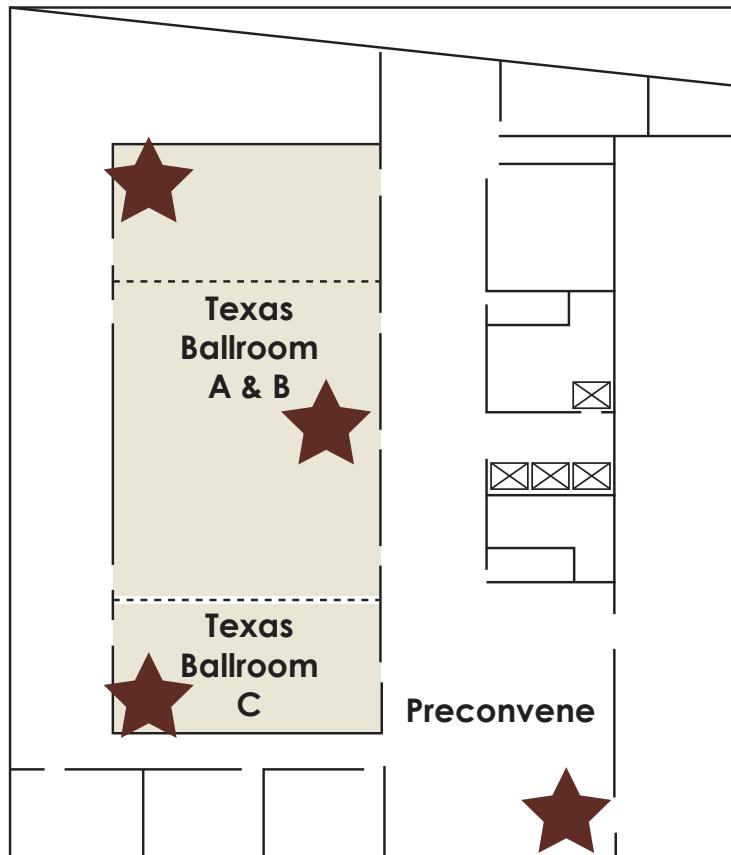

- **SSID ARIN-V6, ARIN-DEMO**
- IPv6 Tunneled
- naptd, totd provide connectivity to IPv4 Internet
- ISC dhcpcd for resolver configuration on supported platforms

Wireless Network

- 7 Wireless Access Points(WAP) ★
- Each WAP supports Multiple SSID's
- Each WAP has Multiple vLAN's
- The WAP's plug into Cisco switches which supports vLAN tagging

Access Point Distribution

Second Floor

Third Floor

Demonstration Time

- **Hardware:** Soekris box, multi-Ethernet
- **Wireless:** Cisco 1200 Wireless Access Point
- **OS:** Linux(Centos 5.3) Most standard distributions would work.
- **Software:** naptd(application gateway), totd(dns), radvd(v6 router advertisement daemon), ISC's dhcpcd version 4.x(auto distributes name servers to some hosts)
- **Tunnel Broker:** Hurricane Electric(HE)

8 Steps to IPv6 only Network

Enable IPv6 forwarding

```
echo "1" > /proc/sys/net/ipv6/conf/all/forwarding
```

Setup the IPv6 Tunnel

```
ifconfig sit0 up  
ifconfig sit0 inet6 tunnel ::216.66.22.2  
#(your tunnel endpoint)  
ifconfig sit1 up  
ifconfig sit1 inet6 add 2001:470:8:53d::/64  
route -A inet6 add ::/0 dev sit
```

Setup your IPv6 gw

```
ifconfig eth0 inet6 add 2001:470:8:53d::1/64
```

8 Steps Con't

Configure RADVD

edit radvd.conf

```
Interface eth1
{
    AdvSendAdvert on;
    AdvManagedFlag off;
    AdvOtherConfigFlag on;
    MinRtrAdvInterval 5;
    MaxRtrAdvInterval 15;
    prefix 2001:470:8:53d::/64
    {
        AdvOnLink on;
        AdvAutonomous on:
    };
};
```

8 Steps Con't

Configure dhcpcd, ISC's dhcpcd 4.x

edit dhcpcd.conf and add the following:

```
default-lease-time 1800;  
max-lease-time 1800;  
ddns-update-style none;  
authoritative;  
log-facility local7;  
option dhcp6.name-servers 2001:470:8:53d::1;  
subnet6 2001:470:8:53d::/64 { }
```

-- start with:

```
dhcpcd -6 -cf /usr/etc/dhcpcd.conf
```

8 Steps Con't

Configure TOTD

```
;dns server to use for resolution
forwarder 24.93.41.125 port 53
;prefix to use for nat-pt hosts
prefix 2000:ffff::
;port to listen on
port 53
pidfile /var/run/totd.pid
totuser nobody
; 6to4 reverse lookup setting
stf
```

8 Steps Con't

Setup NAT/PT using the natd-confmaker Use the defaults

Make sure that the 'prefix' in nat-pt configuration matches the totd prefix of 2000:ffff

For an example of the configurator output, see this link:

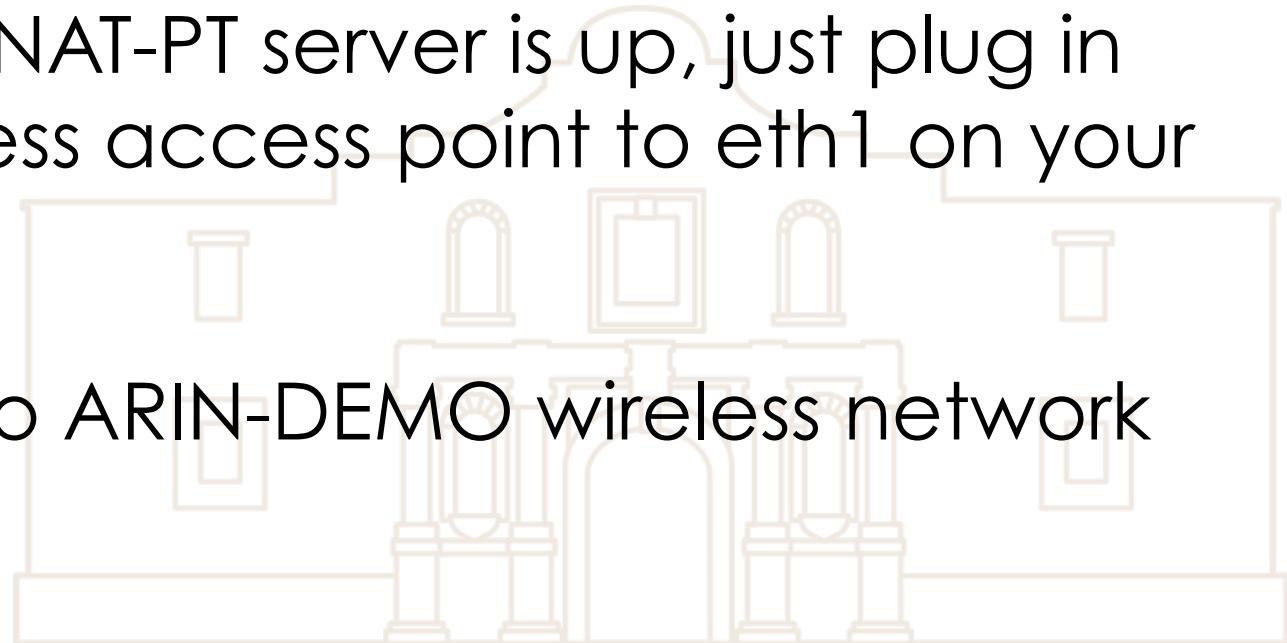

http://getipv6.info/index.php/lv6_at_ARIN_XXI/Network-Setup

Setup a few iptable and ip6table rules

```
/sbin/iptables -A INPUT -i lo -j ACCEPT
/sbin/iptables -A INPUT -m state --state ESTABLISHED,RELATED -j ACCEPT
/sbin/iptables -A INPUT -m state --state NEW -m tcp -p tcp --dport 22 -j accept
/sbin/iptables -A INPUT -j drop
/sbin/ip6tables -A FORWARD -p icmpv6 --icmpv6-type destination-unreachable -j drop
/sbin/ip6tables -A FORWARD -d 2000:ffff:: -j DROP
```

Time to play

- This was all accomplished using Linux, OS commands and freely available software
- Once the NAT-PT server is up, just plug in your Wireless access point to eth1 on your server
- Connect to ARIN-DEMO wireless network

Problems with IPv6 only

- Even with NAT-PT some applications will not work, SIP related applications. At least one SIP ALG is available but breaks the end to end security of the SIP protocol.
- Playing games with icmp messages
- All IPv4 traffic comes from one address
